Control Signals needed in MIPS (P&H book style)

Data path with Control Signals in simple MIPS

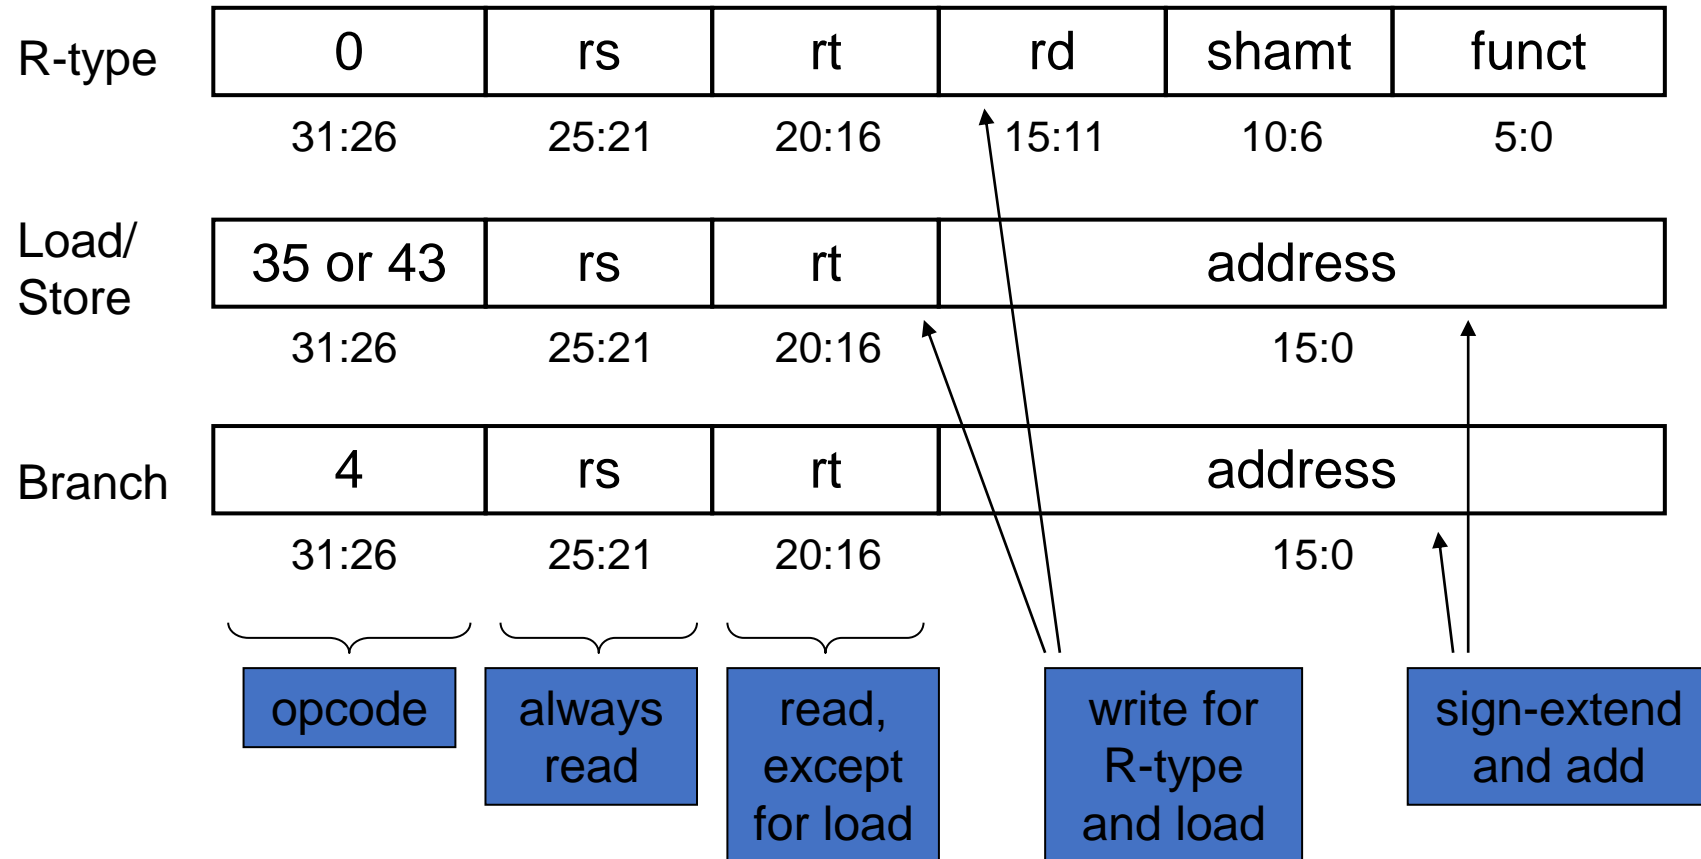

Another (clear) View of Control Signals

The Main Control Unit

- Control signals derived from instruction

Generating Control Signals

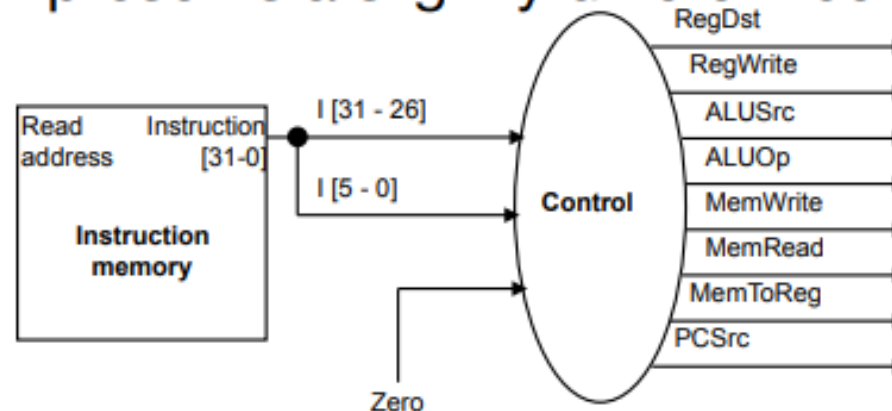

The control unit needs 13 bits of inputs

- ❖ Six bits make up the instruction's opcode
- ❖ Six bits come from the instruction's func field
- ❖ It also needs the Zero output of the ALU

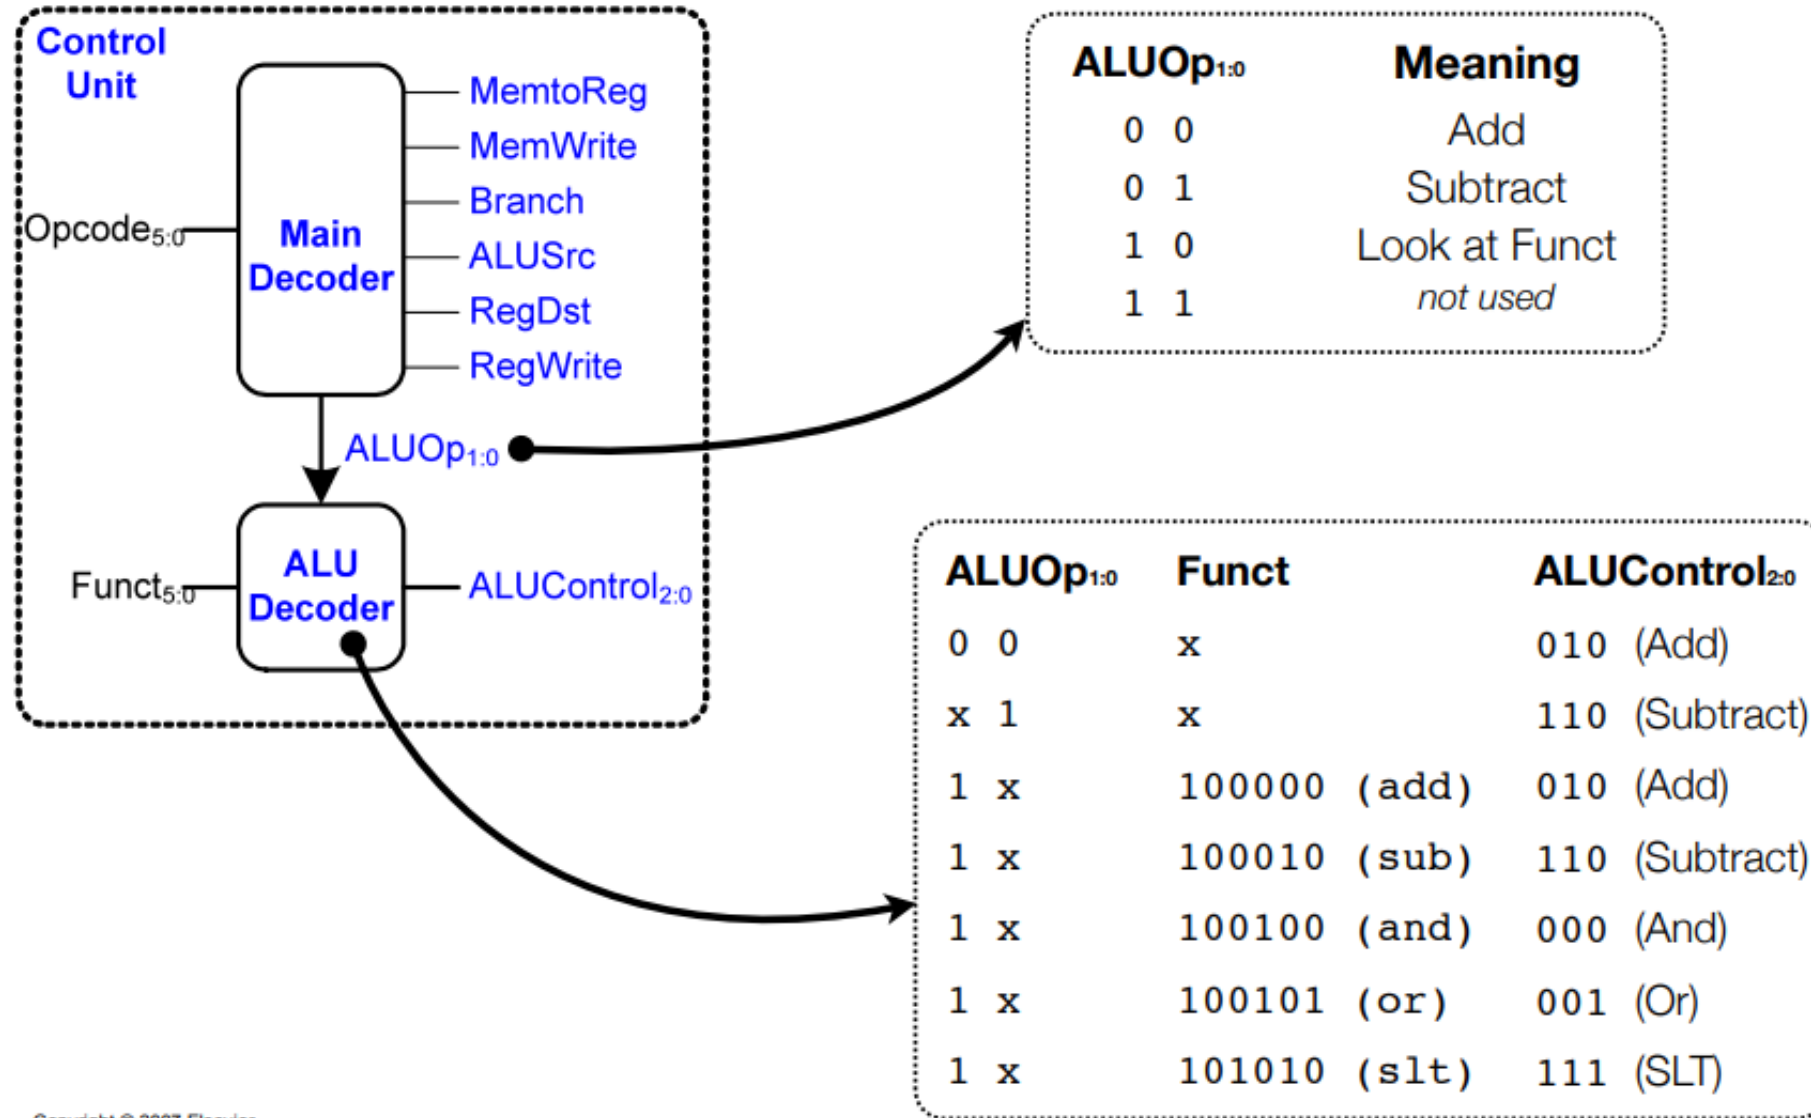

The control unit generates 10 bits of output,
corresponding to the signals mentioned earlier

You can build the actual circuit by using big K-maps,
big Boolean algebra, or big circuit design programs

The textbook presents a slightly different control unit

Control words with ALU Op codes

ALU Control

- Assume 2-bit ALUOp derived from opcode
 - Combinational logic derives ALU control
